

Doxorubicin (dox-oh-ROO-bi-sin) belongs to the general group of medicines known as antineoplastics. It is used to treat some kinds of cancers of the blood; lymph system; bladder; breast; stomach; lung; ovaries; thyroid; nerves; kidneys; bones; and soft tissues, including muscles and tendons. It may also be used to treat other kinds of cancer, as determined by your doctor.

Doxorubicin seems to interfere with the growth of cancer cells, which are then eventually destroyed by the body. Since the growth of normal body cells may also be affected by doxorubicin, other effects will also occur. Some of these may be serious and must be reported to your doctor. Other effects, like hair loss, may not be serious but may cause concern. Some effects may not occur until months or years after the medicine is used.
